## **Adjustment Unit for Film Edge Control for ROVEMA Form, Fill and Seal Machines**

Dear Customer,

The film edge control is essential for a precise and trouble-free film run. It ensures that the film stays in its position and is sealed properly. However, experience shows that the adjustment of the light conductors is time-consuming and that now and then these parts break during format changes.

The new ROVEMA adjustment unit for the film edge control simplifies format changes, eliminates disturbance sources and saves unnecessary procurement costs for replacement parts. Thanks to the separate mounting and support, the fixing to the forming shoulder becomes redundant and the digital indicator optimizes and facilitates the adjustment.

### **The adjustment unit for the film edge control offers you:**

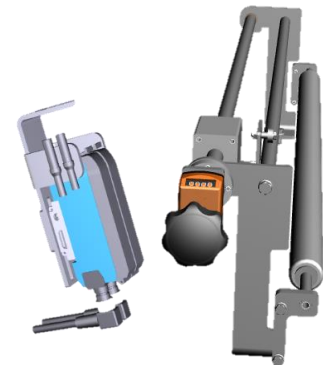

- format changes without removal of the light conductors
- prevention of break of the light conductors
- safe and precise film run
- no more bags with open vertical seal
- easier adjustment of the film edge control
- reproducible settings via digital indicator

### **Content of retrofit kit:**

- film edge control incl. 2 light barriers and light conductors
- mounting for light barriers
- adjustment unit with digital indicator and support for the light conductors

*adjustment unit for film edge control in  
ROVEMA form, fill and seal machine*

*content of retrofit kit*

The adjustment unit can be retrofitted on all vertical ROVEMA form, fill and seal machines. Installation and commissioning takes approx. 1 day plus travel time. In case your machine is not yet equipped with a film edge control, a retrofit is of course possible. We will gladly issue a corresponding offer.

For more information about the adjustment unit for the film edge control or in case of questions about your ROVEMA packaging machine, your contact persons at the ROVEMA Service are always at your disposal.
