Alignment Tool and Set of Toothed Belts for Cross Sealing Station in ROVEMA VPR / VPK / BVK Machines

Dear customer,

Regular maintenance secures a trouble-free production and effectively prevents unplanned downtime. In this context, it is necessary to regularly maintain the cross sealing station, especially in continuously working form, fill and seal machines. This particularly affects the toothed belts and sometimes the gear wheels since a correct alignment of these parts is mandatory for a parallel and smooth run of the sealing tools.

For this purpose, ROVEMA has developed the universally usable alignment tool as a useful aid for the machine types VPR 250, VPK 260 and BVK 260. It consists of two clamps, one for each side, for the fixation of the front and rear drive shaft. This avoids a shifting of the toothed belts during the fitting and tensioning process and optimally aligns the unit for the subsequent installation of the sealing tools. This provides a considerable saving of time during the alignment and helps to preventively avoid serious damage to the sealing tools caused by incorrectly adjusted belts.

Moreover, the ROVEMA package, containing two alignment tools and seven toothed belts according to your machine type, offers you a considerable price advantage compared to an individual order.

Your advantages at a glance:

- easy handling and application
- optimal alignment of drive shafts after exchange of toothed belts
- saving of time through one-time alignment
- avoidance of damage to sealing tools caused by incorrectly adjusted drive shafts
- considerable price advantage

alignment tool for cross sealing station in ROVEMA form, fill and seal machine

The alignment tool can be used on the ROVEMA machine types VPR 250, VPK 260 and BVK 260.

For more information about the alignment tool for the cross sealing station or in case of questions regarding your ROVEMA packaging machine, your contact persons at ROVEMA Service are always at your disposal.
